

Careful battery degradation management practices including augmentation will enable developers to drive greater performance, lower lifetime costs, and keep the renewable energy transition moving forward.

Optionality is key for battery storage developers and owners when considering project augmentation, leading system integrators to enhance their augmentation offering. As Energy-Storage.news has previously written, ...

Defining operational objectives and a project's projected battery use will help owners determine the appropriate augmentation path. A chilled water thermal energy storage system allows utilities to store energy during off-peak periods until it is needed, optimizing renewables while supporting customers' energy needs.

The battery storage sector is about to enter its first ever phase of large-scale augmentations of systems as they reach 3-5 year degradation points and there are questions over how this will pan out, a representative of Burns & McDonnell told Energy-Storage.news.

Augmentation, which refers to supplementing or replacing a battery capacity as it degrades over time, has become an increasingly important topic. As asset owners begin to think about augmentation, how should you ensure the most effective strategy? How to approach augmentation plans, minimizing costs and maximizing efficiency

Let's take augmentation as an example. The pros include deferred capex, and the ability to exploit anticipated cost reductions in batteries down the line. In addition, augmentation means that you only ever pay for the capacity you need, in case your revenue stack reset never happens. These are huge benefits.

Upgrading a 30-minute battery to a one-hour battery or a one-hour battery to a two-hour battery can unlock greater potential revenues. Augmentation also helps to manage degradation (also known as repowering).

An ESS augmentation strategy refers to your plan to maintain the performance of your storage system over its life by either rotating batteries in and out of the system or adding more storage capacity to the base system...or both. Some projects may require battery replacements within 5 years, while others may take longer.
