

Electromagnetic compatibility of photovoltaic inverters

Do photovoltaic systems need electromagnetic compatibility?

Exponential growth of photovoltaic systems connected to the grid has been observed over the last decade in Brazil concurrently with concerns about the power quality and operational compliance of related equipment. In the past decades, there has been much research and debate regarding the definition of electromagnetic compatibility requirements.

Is there a lack of EMC standards for photovoltaic inverters?

However, as suggested [8], the identification of possible violations may show a lack of EMC standards specific to the various items of equipment that comprise grid-connected photovoltaic systems, principally the photovoltaic (PV) inverter.

Are photovoltaic inverters prone to EMI?

Photovoltaic inverters are inherently low-frequency devices that are not proneto radiating EMI. No interference is expected above 1 MHz because of the inverters' low-frequency operation.

Does a PV system have a risk of electro-magnetic interference?

While the risk of electro-magnetic and/or radar interference from PV systems is very low,it does merit evaluation,if only to improve the confidence of site owners and other stakeholders.

Does a PV inverter qualify for RF emission?

Additionally, the Code of Federal Regulations, Title 47, Part 15 regulates radio frequency (RF) emission from commercial products and many PV inverter manufacturers do qualify their residential or utility-scale equipment to this standard.

How does EMI occur in a grid-connected photovoltaic system?

Normally,EMI in the grid-connected photovoltaic system occurs in a conducted or radiated manner, such that propagation of one may generate the other, based on indirect emissions, as seen in [6,17].
