How to calculate solar panel orientation?

The orientation is composed of two parameters: direction and tilt angle. Select your timezone and enter your coordinates (latitude and longitude) to calculate the optimal orientation for fixed solar panels, twice adjusted solar panels, quarterly (seasonally) adjusted solar panels, and monthly adjusted solar panels.

Why does solar panel orientation and angle matter in a solar power system?

Prior to understanding why solar panel orientation and angle matter in a solar power system, we need to know how a solar panel collects energy from the sun. Solar panel cells only collect a specific wavelength during absorbing radiant energy from the sun.

Why is solar panel orientation important?

Your solar panel orientation is an important part of the sizing of photovoltaic and solar thermal systems. Since solar power produced is directly proportional to the orientation of solar panels, the right orientation can not only maximize solar power but also decreases the cost of the project.

What is the tilt angle of solar panels?

If the sun is high in altitude, then the tilt angle would be small and solar panels would be more horizontal. For low altitudes, the tilt angle is large, and solar panels are vertical. The tilt angle for solar panels is dependent on the latitude of the sun. Fixed solar panels are a convenient and preferred choice.

What is a solar panel angle?

The solar panel angle, also known as inclination, refers to the vertical tilt angle between the surface of the solar panel and the ground. As the sun movement varies both geographically and seasonally, you need to adjust solar panel angles specific to the latitude, season, and time of day to maximize the power output.

How to choose a solar installation angle?

If connected to a stand-alone power system, the installation angle of solar panels should be based on the light conditions to obtain the maximum power output. Generally, if the output of the solar panels can be met even on the lowest light intensity of the year, then the solar output at the chosen angle will meet the year-round demand.
