How do I design a photovoltaic and solar hot water system?

Provide an architectural drawing and riser diagram for the homeowner showing the planned location for future photovoltaic and solar hot water system components. Space requirements and layout for photovoltaic and solar water heating system components should be taken into account early in the design process.

Does proficad support photovoltaic circuit diagrams?

ProfiCAD supports the drawing of photovoltaic circuit diagrams. In addition to the common electrical engineering symbols, the library includes symbols such as solar cells, photovoltaic panels, solar collectors, inverters, etc. Should you need more symbols, you can create them in the symbol editor. Some sample drawings (click for full size):

How are PV modules designed to operate at different voltages?

PV modules can be designed to operate at different voltages by connecting solar cells in series. Table 9.1 contains typical parameters that are used in module specification sheets to characterize PV modules.

Can PV modules be placed on a sun-tracking system?

The additional cost of placing PV modules on a sun-tracking system makes this configuration not profitable in most PV applications. The simplest means of electricity storage is to use the electric rechargeable batteries, especially when PV modules produce the DC current required for charging the batteries.

How do you calculate the number of PV modules in series?

The number of modules in series is determined by dividing the nominal PV system voltage with the nominal module voltage (in the specification sheet under configuration). The total number of modules is the product of the number of modules required in parallel and the number required in series.

Can a PV system be connected in series?

Modules can be connected in series or in parallel to form an array. When modules are connected in series, the nominal voltage of the PV system is increased, while the parallel connection of modules results in a higher current in the PV system.
