

What is a combiner box in a photovoltaic system?

In a photovoltaic system, a combiner box acts as a central hub that consolidates and manages the direct current (DC) output of multiple solar panels. Its main purpose is to simplify the wiring structure, enhance system security and simplify maintenance procedures.

What is a PV DC combiner box?

PV DC COMBINER BOX is a complete range of tailor-made Level 1 combiner boxes for utility-scale photovoltaic systems. The combiner boxes are installed to join and protect the DC strings that go from the PV panels to the solar inverter. The PV DC COMBINER BOX product range offers solutions from 8 to 32 inputs and 1 or 2 outputs.

Does a PV combiner box have a DC disconnection switch?

The PV DC COMBINER BOX has a DC disconnection switch by default. The DC voltage of the switch depends on the voltage of the PV string. The switch disconnecting and breaking capacity (according to the IEC 60947-3) has been selected to assure that it can switch the circuit at full load at the maximum operating temperature.

What is a DC ground fault in a PV system?

DC ground faults are the most common type of fault in PV systems and half go undetected. A DC ground fault is the undesirable condition of current flowing through the equipment grounding conductor in the circuits carrying DC power (before the inverter).

What causes a two-stage PV inverter to fail?

Since the two-stage PV inverter has an intermediate DC/DC link, there is a certain voltage difference between the PV module and DC capacitor, and the fault coupling degree of undervoltage is lower than that of overvoltage fault. According to the fault location, the fault causes can be divided into two types: DC short circuit and sampling error.

What causes coupling in DC side of photovoltaic inverter?

There are multiple fault causes coupling in DC side of photovoltaic inverter. The changes of voltage, current and power are derived by fault mechanism analysis. The differences of failure feature are used to locate the fault cause.
