

Principle of power supply when photovoltaic inverter loses voltage

How do inverters affect a grid-connected PV system?

For a grid-connected PV system, inverters are the crucial part required to convert dc power from solar arrays to ac power transported into the power grid. The control performance and stability of inverters severely affect the PV system, and lots of works have explored how to analyze and improve PV inverters' control stability.

How does a PV inverter work?

According to the authors, PV inverters act as a constant power source trying to extract the same power for whatever voltage profile, and it is also affirmed that the manufacturers limit the PV inverters fault current from 1 to 2 pu.

How do PV inverters control stability?

The control performance and stability of inverters severely affect the PV system, and lots of works have explored how to analyze and improve PV inverters' control stability. In general, PV inverters' control can be typically divided into constant power control, constant voltage and frequency control, droop control, etc.

Are PV inverters voltage regulated?

In the modern day, the PV inverters are being developed under the interconnection standards such as IEEE 1547, which do not allow for voltage regulations. However, a majority of manufacturers of PV inverters tend to enhance their products with reactive power absorbing or injecting capabilities without exceeding their voltage ratings.

How does a short-circuit affect a PV inverter?

When there is a voltage drop associated with a short-circuit, the PV inverter attempts to extract the same power, by acting as a constant power source. This way, the higher the voltage drop, the higher the fault current injected by the PV inverter should be.

What happens if a PV inverter fails?

In all cases, the fault is caused at the coupling point of the PV inverter, leading the voltage to zero. In addition, it can be seen that the steady-state fault current of the PV inverters is practically the same for different power factor conditions, i.e., from 1 to 1.1 pu of the pre-fault current (1 pu).
