Will Sams Energy Academy phase out fossil fuels?

After the REI project had been carried out, Samsø, including Samsø Energy Academy, began working on phasing out the remaining shares of fossil fuels that are used on the island. Samsø Energy Academy and several other actors on the island have been working on a vision for a completely renewable energy supply by 2030.

Will Sams become carbon-free by 2030?

Samsø has renewed its ambition and aims to become completely carbon-free by 2030. This means that no fossil fuel will be used, and all the island's energy needs will be covered by renewable energy. This is far ahead of the national ambition in Denmark for 2030 and the EU climate goals for the same year.

How many turbines does Samsø have?

That's good news for Samsø's 4,000 or so inhabitants, seeing as they own shares in 20 of the 21 turbines that either tower over the island or rise from the offshore waters of the Kattegat Strait, which connects the Baltic and North seas.

How did Samsø become sustainable?

As a result of these decisions, three things happened: Vestas, Bonus and Danish wind turbine-makers came to lead their industry globally; a high fossil-fuel tax created generous government subsidies for renewable development; and Samsø became sustainable--producing more energy than it consumed for the first time in 2005 and every year since.

What is Sams Energy Academy?

This academy functions as a professional and popular meeting place for partnerships of small and large energy projects on Samsø, and it attracts thousands of professionals and tourists to the island annually. One of the key projects right now is a plan to make Samsø completely independent of fossil fuels before 2030.

How did Sams get electricity?

At the time, the island's electricity came via an undersea cable from mainland Denmark's grid, with coal supplying most of the power. Oil shipped from the mainland was the primary energy source for heating Samsø's homes and businesses, as it was also for virtually all transportation on the island.

The Samsø Energy Academy is a project co-funded by the European Regional Development Fund. Samsø has been chosen as Denmark's island of renewable energy. T...

By George Harvey Samsø is an island off the northeastern coast of the mainland part of Denmark. It is about 43 square miles and has a population of about 4000. ... At the time, 100% of energy in Samsø came from imported fossil fuels. Islanders were emitting 11 ton of carbon dioxide per capita each year, one of

the highest rates in Europe ...
